A successful deployment for SQL Database in azure

Microsoft Azure portal showing the EventEaseDb (motseoserver/EventEaseDb) Query editor (preview). The query editor displays a SQL query: `SELECT * FROM [dbo].[Venue]`. The results table shows two rows of venue data:

VenueId	VenueName	Location	Capacity	ImageUrl
1	Zanzou	Hartfield	500	https://zanzou.co.za/
2	Drama	Braamfontein	1000	https://southafrica.tortoisepath.com/wp...

Query succeeded | 0s

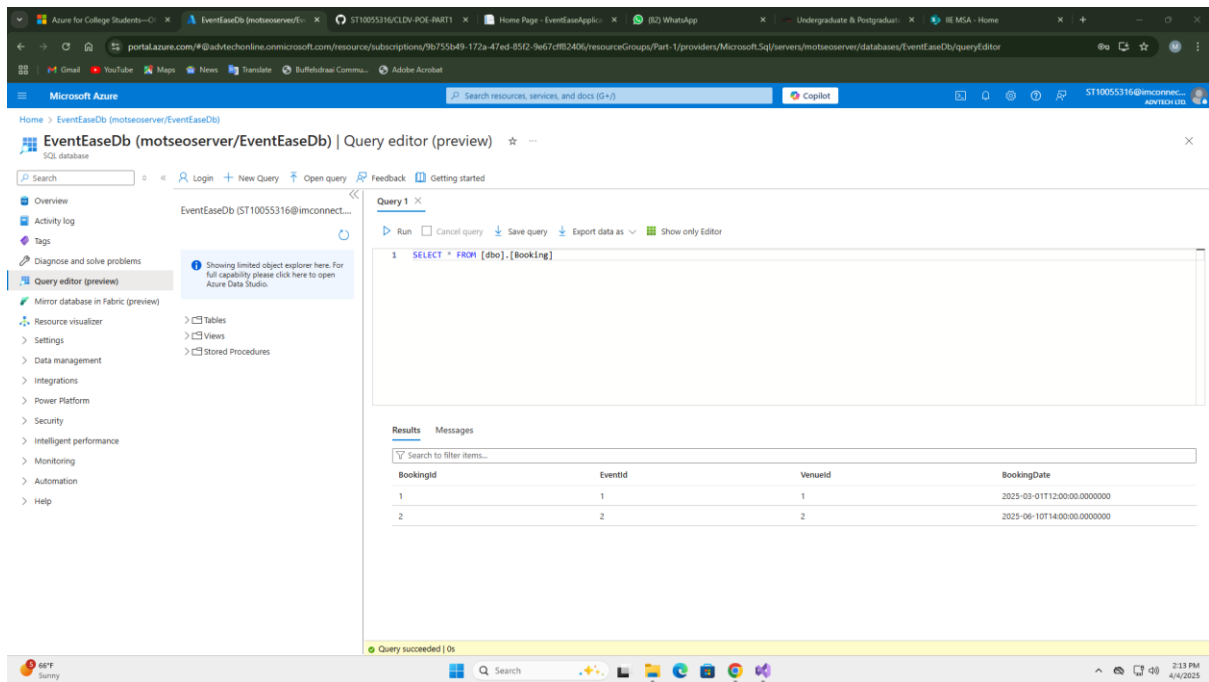

This is the information for venue

Microsoft Azure portal showing the EventEaseDb (motseoserver/EventEaseDb) Query editor (preview). The query editor displays a SQL query: `SELECT * FROM [dbo].[Event]`. The results table shows two rows of event data:

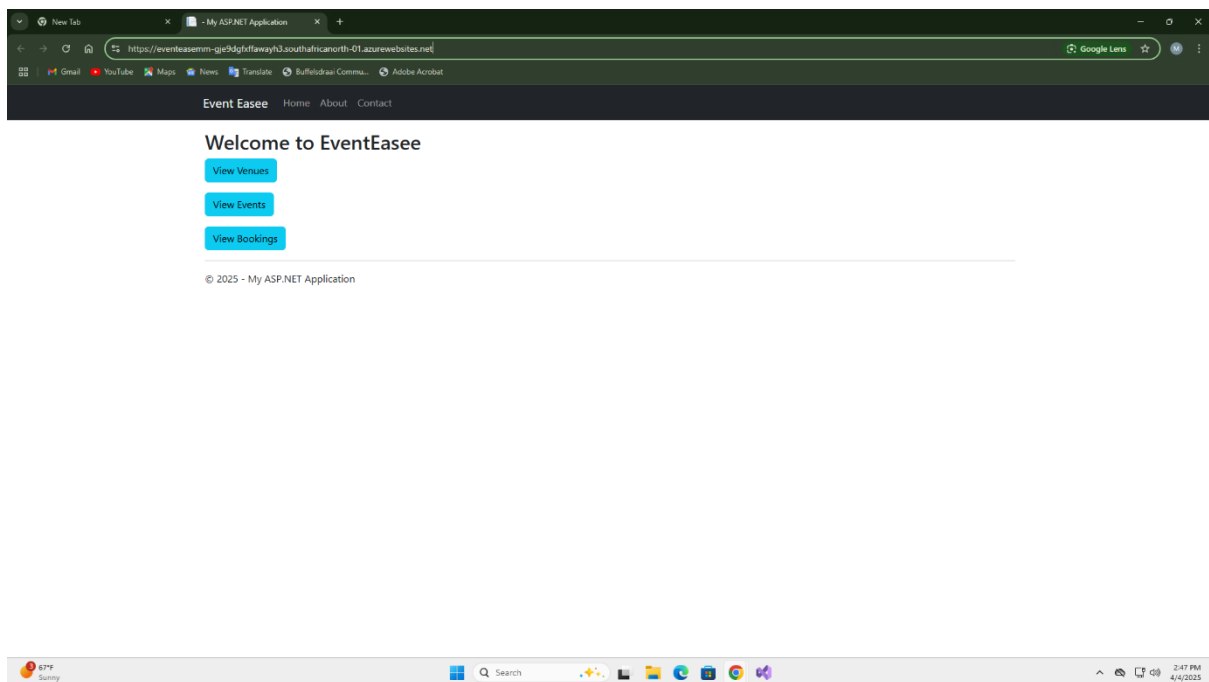

EventId	EventName	EventDate	Description	VenueId
1	Ladies Love Zanzou	2025-04-27T18:00:00.0000000	Semester Party	1
2	Pizza Sundays	2025-07-20T18:00:00.0000000	Student Nights	2

Query succeeded | 0s

This is the information for event

This is the information for booking

Theoretical questions

1. Difference Between Deploying On-Premises and In the Cloud

Hosting IT infrastructure in a company's own data center is known as "on-premises deployment." Physical gear, software, and networking components must be bought, maintained, and managed by businesses. strong upfront expenses and continuous maintenance obligations accompany this model's strong control and security features (Stallings & Brown, 2020).

On the other hand, cloud deployment entails putting IT resources on external cloud service providers such as Google Cloud, AWS, or Microsoft Azure. Because the provider oversees the infrastructure, the cloud model offers scalability, cost-effectiveness, and less maintenance work. It might, however, raise issues with compliance, data security, and dependence on outside vendors (Mell & Grance, 2011).

2. Key Differences Between Azure Hosting Models

Azure provides several hosting models, each with its unique characteristics:

- **Infrastructure as a Service (IaaS):** offers networking, storage, and virtual machines. Although they depend on Azure for hardware management, users have complete control over the operating system and apps (Microsoft, 2023).
- **Platform as a Service (PaaS):** provides a platform for developers to manage apps while Azure takes care of the supporting infrastructure, such as scaling and OS updates (Rittinghouse & Ransome, 2017).
- **Software as a Service (SaaS):** provides fully functional apps that are hosted and controlled by Azure. Users don't control the platform or infrastructure; they just engage with the software (Microsoft, 2023).
- **Serverless Computing:** lets programmers run code without worrying about server management because Azure manages resource allocation dynamically (Buyya et al., 2019).
